

Activity 7 Instruction Manual

Activity 7 | Topic 01 | C013 | Version v1.0

Purpose

An RTM proves that what you built is what was asked for. GenAI can populate one quickly, but it will happily invent requirement sources - which is exactly the failure mode an RTM exists to prevent.

Files used

- activity-guide.md and activity-guide.pdf - brief and source instructions
- prompts.pdf - reusable prompt and verification checklist
- mock-data.xlsx - safe fictional project data for practice

Expected output

A complete Requirements Traceability Matrix with verified sources.

Before you begin

1. Form the required group and assign one person to capture evidence.
2. Open mock-data.xlsx and review the title, note and column headings.
3. Open prompts.pdf beside your chosen GenAI tool. Do not upload confidential workplace data.

Detailed procedure

1. In your group, open 'Requirements Traceability Matrix.xlsx' from the template pack.
2. Prompt GenAI: 'Generate 5-10 sample requirements for a smart city parking app. Include: Requirement ID, Description, Source, and Test Case ID.' - or use your own project.
3. Try the worked example too: 'Generate a Requirements Traceability Matrix for an e-health app for appointment booking. Include requirement ID, description, stakeholder source, and test case.' Compare the structure of the two outputs.
4. Paste the output into the template. Now audit the Source column - for each row, ask 'which real stakeholder or document did this come from?'
5. Delete or re-source every requirement whose source the AI invented. This is the single most important step in this activity.
6. Link each requirement forward to the scope statement, an acceptance criterion and a test case ID so the trace is complete end to end.
7. Prompt GenAI to check your work: 'Review this RTM. Which requirements have no test case, and which test cases do not trace back to a requirement?'
8. Fix the gaps it finds and share your matrix with the class.

Use the supplied mock data

Copy only the rows needed for the current step and tell the model the data is fictional. If the model changes an identifier or number, reject the change and rerun with an explicit preserve-values instruction.

Quality control

- Every row traces from a real, named source through to an acceptance criterion and a test case, with no orphan requirements or orphan tests.
- Compare the first AI draft with the final human-corrected artifact and retain both as evidence.
- Label assumptions, decisions, owners and dates so another project manager can audit the result.

Troubleshooting

If the response is generic, add the project objective, constraints, audience and required columns. If arithmetic is inconsistent, request formulas and substitutions, then calculate independently. If a source cannot be opened, remove the claim or replace it with verified evidence.

Submission evidence

Submit the completed project artifact, the final prompt, a short critique of the AI output, and any screenshot or exported file required by the activity.
