

Activity 11 Direct Project Work and Report Performance with GenAI

Activity 11 | Topic 02 | C013 | Version v1.0

Course: Generative AI for Project Management (C013) Topic 02: Project Execution and Delivery with GenAI Learning outcome: LO2 - Turn raw project data into work performance information and reports. Tools: GenAI tool | Project Manager Buddy GPT

Goal

Executing a project generates a flood of raw data. You will use GenAI to turn that data into information, and information into a report a sponsor will actually read - while learning the distinction that PMBOK draws between the three.

What you'll produce

A project status report generated from raw work performance data.

Core prompt

```
Here is raw work performance data from my project [paste]. Compare it with the plan, distinguish data fr
```

Step-by-step

1. In your group, write out ten lines of raw work performance data for a project in progress - for example '14 defects open', 'actual cost to date \$62,000', '3 change requests raised'.
2. Confirm the distinction before you prompt: Data is the raw observation; Information compares two or more data points to make it meaningful; a Report is the representation intended to raise action or awareness.
3. Prompt GenAI: 'Here is raw work performance data from my project [paste]. Convert it into work performance information by comparing against the plan, then produce a one-page status report for an executive sponsor.'
4. Check what it inferred. It will assume a baseline you never gave it - identify every comparison it invented and supply the real planned figure.
5. Prompt it to sharpen the report: 'Rewrite this so the first three lines tell the sponsor whether the project is on track, what the single biggest problem is, and what decision I need from them.'
6. Add a version control block - version number, date/time stamp and author - as required for project document control.
7. Use the Persona pattern to test it: 'Act as a sceptical project sponsor. What would you challenge in this report?' Address the challenges it raises.
8. Share your report and state which figure GenAI fabricated before you corrected it.

Check your work

Check: Your report distinguishes data from information, every comparison uses a real baseline figure, and it opens with status, biggest problem and the decision required.

Remember: GenAI gives you a fast first draft. Check every figure, source and assumption before the output leaves your hands - you remain accountable for it.
