

Activity 19 Instruction Manual

Activity 19 | Topic 03 | C013 | Version v1.0

Purpose

You cannot act on fifty risks. Qualitative analysis prioritises them so you spend your attention where it matters - and you will test how consistent GenAI's scoring actually is.

Files used

- activity-guide.md and activity-guide.pdf - brief and source instructions
- prompts.pdf - reusable prompt and verification checklist
- mock-data.xlsx - safe fictional project data for practice

Expected output

A scored probability/impact matrix with a prioritised risk shortlist.

Before you begin

1. Form the required group and assign one person to capture evidence.
2. Open mock-data.xlsx and review the title, note and column headings.
3. Open prompts.pdf beside your chosen GenAI tool. Do not upload confidential workplace data.

Detailed procedure

1. Take your risk register from Activity 18. Prompt GenAI: 'Score each risk for probability (1-5) and impact (1-5), calculate the risk score, and place each in a probability/impact matrix.'
2. Run the same prompt a second time in a new chat. Compare the two sets of scores - you will find they differ. Discuss what that inconsistency means for relying on AI scoring.
3. Agree your group's own scores for the top ten risks. Use GenAI's output as a prompt for discussion, not as the answer.
4. Plot the risks on the probability/impact matrix and identify the red zone - high probability, high impact - that needs a response plan.
5. Apply the additional risk factors to your top five: urgency, proximity, dormancy, manageability, controllability, strategic impact, connectivity and propinquity.
6. Prompt: 'For these top five risks, assess proximity (how soon it could occur) and dormancy (how long before we would notice it).' A high-dormancy risk needs a detection mechanism, not just a response.
7. Update your risk register with the agreed scores, the factor assessments and a priority ranking. Share your top three risks with the class.

Use the supplied mock data

Copy only the rows needed for the current step and tell the model the data is fictional. If the model changes an identifier or number, reject the change and rerun with an explicit preserve-values instruction.

Quality control

- Your top ten risks have group-agreed scores, your top five carry proximity and dormancy assessments, and you can explain why AI scoring alone is not sufficient.
- Compare the first AI draft with the final human-corrected artifact and retain both as evidence.
- Label assumptions, decisions, owners and dates so another project manager can audit the result.

Troubleshooting

If the response is generic, add the project objective, constraints, audience and required columns. If arithmetic is inconsistent, request formulas and substitutions, then calculate independently. If a source cannot be opened, remove the claim or replace it with verified evidence.

Submission evidence

Submit the completed project artifact, the final prompt, a short critique of the AI output, and any screenshot or exported file required by the activity.
